that combines linear interpolation with basic flood-fill algorithm. the flooding step is used to store information about the visited nodes in the map, this step is then repeated for each node that is reached by the algorithm, until it reaches the sink node.

Implementation All images are shown in digital form, generated using vector graphics software like Adobe Illustrator and Adobe Photoshop. See also Chemical graph notation Chemical graph List of chemical graph notations References External links Category:Chemical graphs[Factors affecting the specificity of the test and the applicability of the test in the complex evaluation of the resistance of the bacterial population in water]. The paper presents the information obtained in studying the effect of pH, salinity and temperature of incubation on the sensitivity of the bacteriological test, the specificity of this test, and the applicability of the test in the complex evaluation of the resistance of the bacterial population in water. The data obtained show that the sensitivity of the test is determined by the sensitivity of the nutrient broth and that the specificity of this test is determined by the nature of the test organisms. The temperature and salinity of the incubation in the test do not affect the sensitivity of the test but their influence on the specificity is essential. The test can be carried out in the temperature range of +4--+42 degrees C and in the salinity range of 0.5--+5.0% (w/v) NaCl. The sensitivity of the test does not depend on the pH of the water being tested. The effectiveness of the test for evaluation of the bacterial population's resistance to disinfectants depends on the degree of the pathogenicity of the test organisms, the duration of their survival in water, and the efficiency of the disinfectant under study.1. Technical Field The present invention relates to a lens barrel that drives a lens group. 2. Related Art Lens barrels have been used to perform various types of focus adjustment and zoom adjustment. For example, there has been a lens barrel that adjusts the position of a plurality of lenses within the lens barrel. Such a lens barrel includes a rotation shaft, and a plurality of pinions that are fitted on the rotation shaft, and rotates the rotation shaft, by moving the pinions along the rotation shaft. A lens barrel including a drive motor and a plurality of pinions that are fitted on a rotation shaft is well known. In such a lens barrel 82157476af
